

The Author read in the late 1970's that Todd Rundgren engineered and utilized a Column-based touring sound system.

The iteration: Column cabinet configuration driven with only wide range guitar loudspeakers. Rundgren apparently desired to exploit the overall clarity found with wide range drivers in Column Cabinet systems. Apparently driver subgroups in the column cabinets would use a dedicated EQ to produce requisite low, mid and high frequencies from the wide range guitar speakers.

The author has executed multiple internet searches without success to currently confirm this 1970's PA system utilized by Mr Rundgren. Please forward any additional information to krism@usenclosure.com.
